Introduction

This is an evaluation of the whole Unit-13 assignment which includes:

- Documentation description
- Building of the website from wireframe to the final product
- Feedback
- Sources

Evaluation

Meeting the requirements

To meet owner's requirements, designers and maintainers had to complete certain tasks.

Designers

Create a layout that would be easy to navigate

The designer has met the criteria and was able to create such a layout.

Produce at least 8 pages

The designer has met the criteria and produced 8 pages of content which includes: Home, About Us, Contact Us and 5 product pages.

Choose fonts for the website

The designer has met the criteria by choosing 3 different fonts which are: "Merriweather", "Oswald", "Work Sans".

Create a colour scheme that would be used for the website

The designer has met the criteria by choosing 5 colours for the color scheme: FF7300(Safety Orange), 000000(Black), 67697C (Black Coral), D3D4D9(Light Gray), BB0A21(Firebrick).

Make sure that images are the same size

The designer has met the criteria by using pictures from the same website. This way was faster since it doesn't require any photo editing.

Conclusion

The designer has met all the criteria needed to complete owner's requirements.

Maintainers

Make sure all the documentation is up-to date

The maintainer has met the criteria by reading through documents and updating it if needed.

Create a GitHub repo for the project

The maintainer has met the criteria by creating and linking the GitHub repo.

Make sure all the links to source files are functional

The maintainer has met the criteria by updating the asset list and checking out the links.

Make sure the website is functional

The maintainer has met the criteria by occasionally testing out the website on different browsers: Google Chrome Version 89.0.4389.90 and Firefox 68.0.

Conclusion

Maintainer has met all the criteria needed to complete owner's requirements.

Visitors

The website can be accessed

Visitors were able to access the website without any issues.

The website has functional navigation

Visitors were able to navigate throughout the page by using navigation bar or clicking on the images.

The website is responsive

Visitors were able to navigate throughout the website on different size screens although smaller screens seem to have some issues. For example: Navigation bar ending up behind the page content or content doesn't seem too responsive although it still works.

The website has content appropriate to the business

Visitors didn't see anything but the phones, which means yes it is appropriate.

Conclusion

Visitors had barely any issues going to the website and navigating it.

Changes

Layout

We had minor changes made with the layout. For example, in the previous prototype the text on the home page was not planned, but we implemented it because the website gives more content and context on what it has.

Why is it beneficial?

Because the first thing visitors see is the home page, and if we add more content in, the visitors will have more idea about the website, what it offers, how is it any different and so on and so on.

Phone Page

The buy page has been implemented with a carousel, instead of just having a static picture like in a prototype which allows more content to be added in one place.

Why is it beneficial?

It attracts more attention to the product, because there is a video about the product which may give sense that the phone is popular between people.

About Us Page

In the prototype this page was not planned, but we introduced it to provide more content.

Why is it beneficial?

Well people might want to know more about company, which can lead to more loyal costumers that will end up using this company for their tech instead of others.

Feedback

I have asked my peers for feedback on my website. This is what I received:

Name	Number	Comment
Viktor	1	The phone pictures should be better if they were centered bellow the description of the phone, so the grey part can be on the whole width of the page. To many colours used on the webpage, it will be nice if they were no more than two. The background colour is so bright. In "about us" page the drop-down menu opens up infront of the page causing some kind of bug.
Morgan	2	Background is too much, as in my eyes are drawn more towards the background rather than the phones. Phones need to be more centered, not behind an image. The about us page needs to expand through the whole page rather than the squared space.

Does it meet the minimal requirements?

Yes, it does, the website is functional, and it can be navigated trough.

Are there any constraints that could affect the way website performs?

Yes, there are some bugs and styling issues that could be fixed in a later build. For example: Drop down menu on mobile view tends to go under content in About us page when extended. Other issues are that the nav bar does not span trough the whole pages and cuts off on the sides.
